Solar system 5% ahead of estimate in first 6 months...

Case Study

Mr & Mrs Bain's 16 panel SHARP 3.92Kwp system was installed at their Durham home on 6th May 2011.

The SAP estimate for the system based upon orientation and roof pitch was that it would produce 3200Kwh of electricity per annum for which the Bain's would be paid 43.3p per Kwh. After 6 months, the system has produced 2260Kwh of electricity, netting them £978 in cash and making savings on their electricity bills.

The system is approximately 5% ahead of estimate at this stage. The Bain's will easily exceed their 10% annual return on investment in year one and the effect of inflation and rising energy costs means their return will grow annually for 25 years – and it is tax free!
